SAFETY INSTRUCTIONS

The installer of the equipment must read the safety instructions before attempting to install the equipment.

Indicates a potentially hazardous situation which, if not avoided, will result in death or serious injury.

Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

Indicates a potentially hazardous situation which, if not avoided, could result in minor or moderate injury.

Warning, Caution

Prohibitive Action

Mandatory Action

DANGER

Wear a safety belt and hard hat when working on the antenna unit.

Serious injury or death can result if someone falls from the radar antenna mast.

WARNING

Do not open the equipment unless totally familiar with electrical circuits and service manual.

SHOCK **HAZARD**

ELECTRICAL Only qualified personnel should work inside the equipment.

Construct a suitable service platform from which to install the antenna unit.

Serious injury or death can result if someone falls from the radar antenna mast.

Turn off the power at the mains switchboard before beginning the installation.

Fire, electrical shock or serious injury can result if the power is left on or is applied while the equipment is being installed.

Be sure that the power supply is compatible with the voltage rating of the equipment.

Connection of an incorrect power supply can cause fire or damage the equipment.

Use only the specified power cable.

Fire or damage to the equipment can result if a different cable is used.

Use a disconnecting device (ex. breaker) to connect this equipment to the mains switchboard.

WARNING

Do not install the monitor unit, processor unit or control unit where they may get wet from rain or water splash.

Water in the units can result in fire, electrical shock, or damage the equipment.

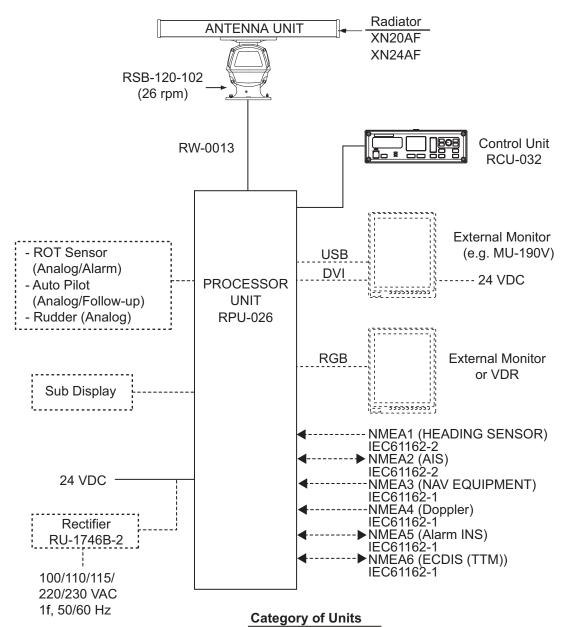

Ground the equipment to prevent electrical shock and mutual interference.

Observe the following compass safe distances to prevent deviation of a magnetic compass:

	Standard compass	Steering compass
Antenna Unit	1.35 m	0.85 m
Processor Unit	0.70 m	0.40 m
Control Unit	0.60 m	0.35 m

1. MOUNTING

NOTICE

Do not apply paint, anti-corrosive sealant or contact spray to coating or plastic parts of the equipment.

Those items contain organic solvents that can damage coating and plastic parts, especially plastic connectors.

1.1 Antenna Unit

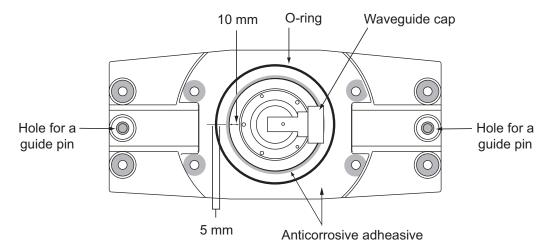

1.1.1 Mounting considerations

- The antenna unit is generally installed either on top of the wheelhouse or on the radar mast, on a suitable platform. Locate the antenna unit in an elevated position to permit maximum target visibility.
- No funnel, mast or derrick should be within the vertical beamwidth of the antenna in the bow direction, especially zero degrees ±5°, to prevent blind sectors and false echoes on the radar picture.
- It is rarely possible to place the antenna unit where a completely clear view in all
 directions is available. Thus, you should determine the angular width and relative
 bearing of any shadow sectors for their influence on the radar at the first opportunity
 after fitting.
- Locate the antenna of a direction finder clear of the antenna unit to prevent interference to the direction finder. A separation of more than two meters is recommended.
- To lessen the chance of picking up electrical interference, avoid where possible routing the signal cable near other onboard electrical equipment. Also avoid running the cable in parallel with a power cable.
- A magnetic compass will be affected if placed too close to the antenna unit. Observe the compass safe distances shown on page ii to prevent deviation of a magnetic compass.
- Do not paint the radiator aperture to ensure proper emission of the radar waves.
- The antenna base is made of cast aluminum. To prevent electrolytic corrosion of the
 antenna base, use the seal washers and corrosion-proof rubber mat and ground the
 unit with the ground wire (supplied).
- Deposits and fumes from a funnel or other exhaust vent can adversely affect the aerial performance and hot gases may distort the radiator portion. The antenna unit must not be mounted where the temperature is more than 55°C.
- Leave sufficient space around the unit for maintenance and servicing. See the antenna unit outline drawing for recommended maintenance space.

1.1.2 How to assemble the antenna unit

The antenna unit consists of the antenna radiator and the antenna unit chassis, and they are packed separately. Fasten the antenna radiator to the antenna unit chassis as below:

- 1. Attach two guide pins to the underside of the antenna radiator.
- 2. Remove a waveguide cap from the radiator bracket. The cap may be discarded.
- 3. Coat the waveguide flange with anticorrosive adheasive as shown below.

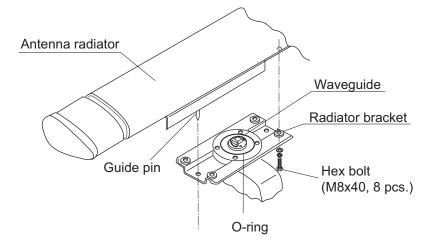

- 4. Coat fixing holes for the antenna radiator with anticorrosive adheasive.
- 5. Grease the O-ring and set it to the O-ring groove of the radiator flange.
- 6. Set the antenna radiator to the radiator bracket.
- 7. Coat hex bolts M8x40 with anticorrosive adheasive and use them to loosely fasten the antenna radiator to the antenna unit chassis.
- 8. Remove two guide pins (inserted at step 1), and then tighten fixing bolts.

Be sure to remove the guide pins.

Injury may result if the guide pins loosen and fall.

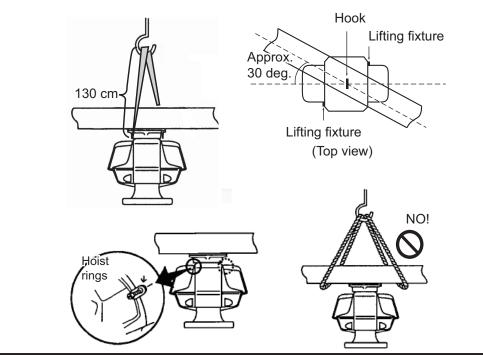

1.1.3 How to fasten the antenna unit to the mounting platform

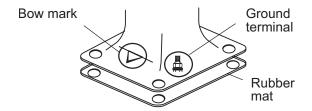

The antenna unit may be assembled before hoisting it to the mounting platform. However, do not lift the antenna unit by the radiator. Always hold the unit by its housing. When using a crane or hoist, use the hoist rings which should be fastened to the bolt fixing covers of the antenna housing.

NOTICE

- -To hoist antenna unit aboard vessel, attach ropes to lifting fixtures and hoist unit with crane.
- To remove load from radiator when hoisting, the length of the rope between the radiator base and the hook on the should be at least 130 cm.
- To keep the rope away from the radiator, turn the radiator and chassis approx. 30 degrees as shown below.
- Be sure to remove the lifting fixtures after hoisting is completed.

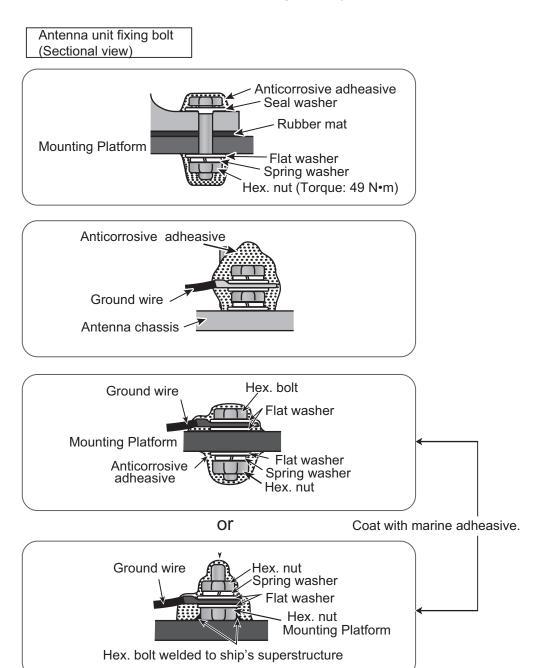

- 1. Construct a suitable mounting platform referring to the outline drawing at the end of this manual.
- 2. Drill four mounting holes of 15 mm diameter and one cable entry hole of about 50 mm diameter in the mounting platform.
- 3. Lay the rubber mat (supplied) on the mounting platform.
- 4. Place the antenna unit on the rubber mat, orienting the unit so the bow mark on its base faces the ship's bow.

1. MOUNTING

- 5. Fasten the antenna unit to the mounting platform with M12x60 hex. bolts, nuts, flat washers and seal washers.
- 6. Use hex. bolt (M6x25), nut (M6) and flat washers (M6) to establish the ground system on the mounting platform as shown below. The location should be within 340 mm of the ground terminal on the antenna unit. Connect the ground wire (RW-4747, 340 mm, supplied) between the grounding point and the ground terminal on the antenna unit. Coat the entire ground system with adhesive (supplied).

The ground point must be within 300 mm from the ground termninal on the antenna unit.

7. Confirm that the hoist rings are removed.

1.2 Processor Unit

1.2.1 Mounting consideration

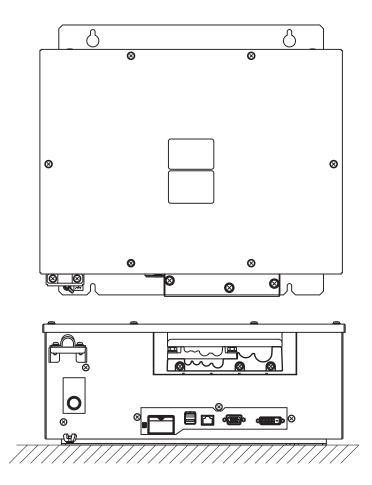

The processor unit can be mounted on a desktop or bulkhead. When selecting a mounting location, be careful about the following points:

- Locate the unit out of direct sunlight and away from heat sources because of heat that can build up inside the cabinet.
- Locate the equipment away from places subject to water splash and rain.
- Select a mounting location considering the length of the cables connected.
- Leave sufficient space on the sides and rear of the unit to facilitate maintenance. (See the outline drawing at the back of this manual.)
- A magnetic compass will be affected if placed too close to the processor unit. Observe the compass safe distances shown on page ii to prevent deviation of a magnetic compass.

1.2.2 How to mount the processor unit

Desktop installation

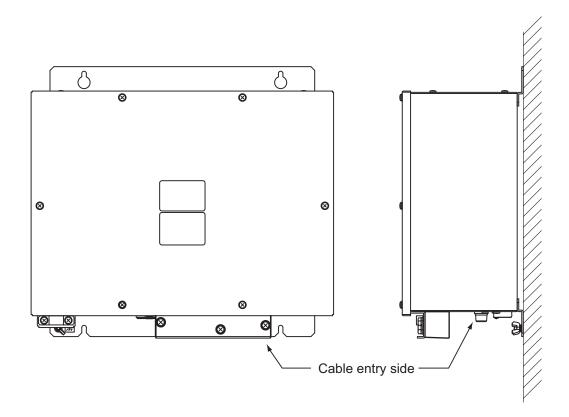

Fasten the unit with four bolts (M5, supplied) or self-tapping screws (5x20).

Bulkhead installation

Note: The cable entry side should be downward when the processor unit is mounted on the bulkhead.

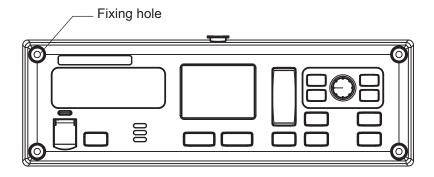

- 1. Mark location for four self-tapping screws if screws will be used.
- 2. Insert four bolts (M5, supplied) or self-tapping screws (5x20), leaving approx. 5 mm of the bolts (screws) exposed.
- 3. Hang the processor unit on the four bolts (screws) inserted at step 2.
- 4. Tighten all bolts (screws).

1.3 Control Unit

The control unit can be installed on a desktop. The control unit should be mounted within five meters from the processor unit since the length of the cable connecting them is five meters.

- 1. Drill four mounting holes of 5 mm diameter referring to the outline drawing at the back of this manual.
- 2. Fix the control unit with four self-tapping screws (ϕ 4) from the top of the control unit. The M4 screws with a sufficient length for the thickness of the tabletop should be provided locally.
- 3. Attach four cosmetic caps to the fixing holes on the control unit.

1.4 Monitor Unit

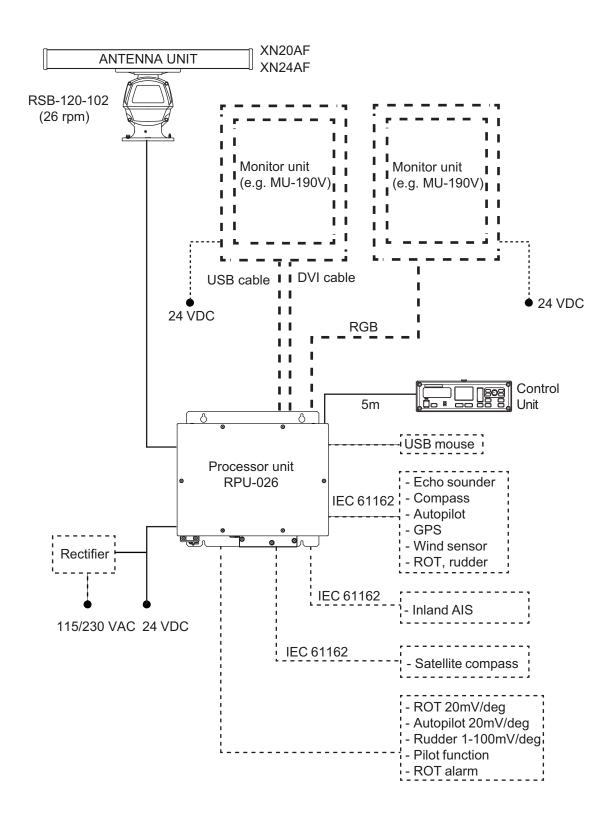

The system is designed with the MU-190V (local supply) in mind. The output video signal is in portrait format. For configurations with monitors other than the MU-190V, consider the following points at installation:

- For monitors other than the MU-190V, brightness cannot be adjusted from the menu or the control unit. Adjust brightness at the monitor itself.
- The output video signal from the FR-1908V-BB cannot be flipped upside-down. For this reason, when installing a landscape monitor select a location that allows the monitor to be installed after rotating the monitor 90 degrees clockwise.
- When using a landscape monitor which has been rotated, the viewing orientation angles change. This can cause the colors of echoes, etc to change, depending on the viewing angle.

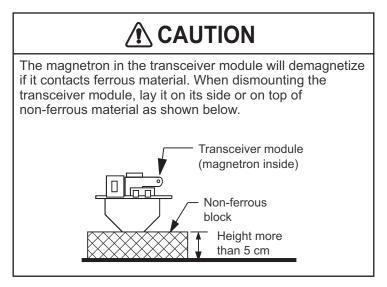

1. MOUNTING

This page is intentionally left blank.

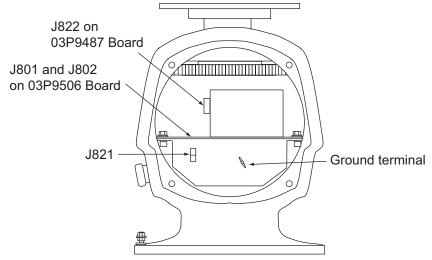

2. WIRING

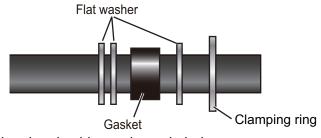

2.1 Antenna Unit

- 1. Open the antenna cover.
- 2. Disconnect plugs P821, P822, P801 and P802.

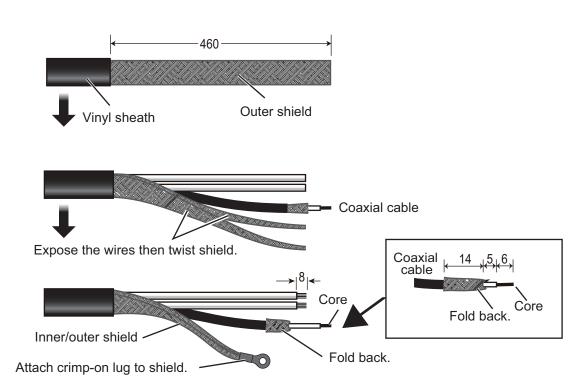

- 3. Unfasten the transceiver module (two bolts). Remove the transceiver module.
- 4. Unfasten four fixing bolts on the cable gland at the base of the antenna unit. Remove clamping ring, rubber gasket and washers.
- 5. Pass the signal cable through the cable entry hole in the antenna unit mounting platform. Trim the cable to 800 mm length from the cable gland.
- 6. Slide two washers, rubber gasket, washer and clamping ring onto the cable in that order.

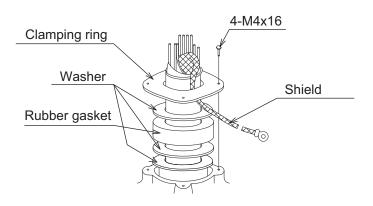

- 7. Fabricate the signal cable as shown in below.
 - 1) Remove the vinyl sheath for a length by 460 mm.

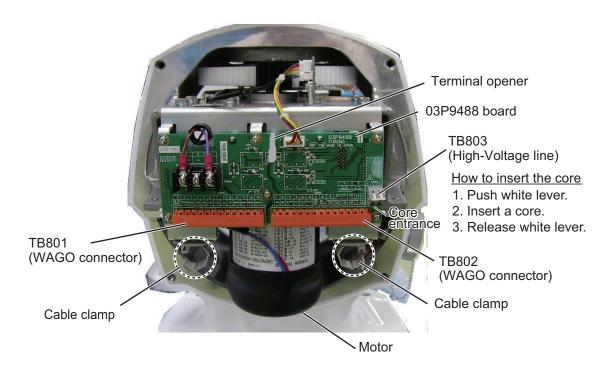

- 2) Unravel the outer shield to expose the cores in the outer layer. Then, expose the cores in the inner layer. Label all inner cores to aid in identification.
- 3) Trim each core (except coaxial wire) considering its location on the terminal board.
- 4) Trim the inner and outer shields leaving 510 mm each. Twist shields together and attach crimp-on lug FV5.5-4 (yellow, φ4.)
- 5) Remove insulation of each core approx. 8 mm.
- 8. Fabricate the coaxial cable.

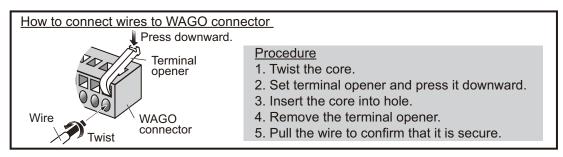

9. Pass the shield between the clamping ring and the washer as shown below. Fasten the clamping ring with the screws.

10. Connect the signal cable to the terminal board TB801, TB802 and TB803 on the 03P9488 board, referring to the interconnection diagram.

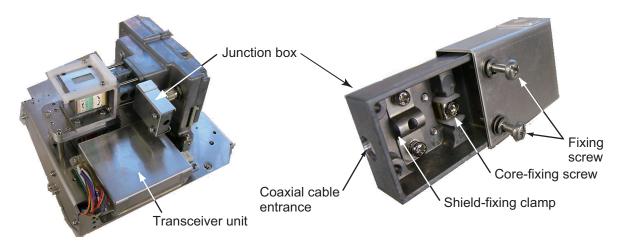

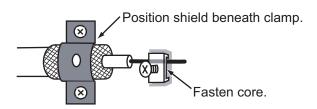

11. Pass the coaxial cable under the transceiver fixing plate (arrow) and the clamp (dashed circle).

12. Detach the junction box from the transceiver unit.

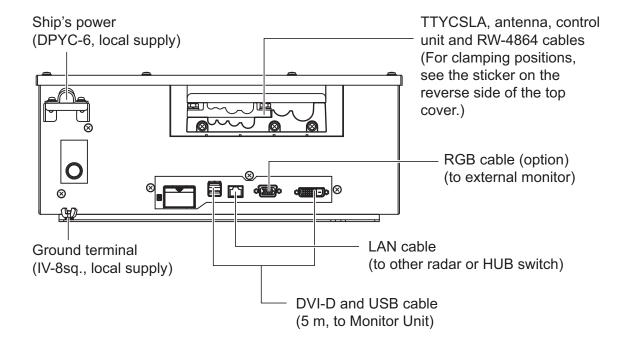

13. Loosen the two screws on the junction box, then slide the cover to open the box. Connect the coaxial cable as shown below.

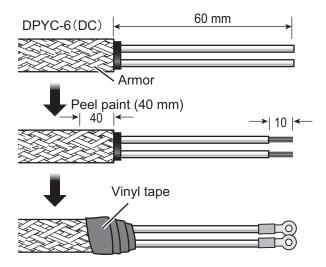

- 14. Close the junction box and tighten the screws. Reattach the box to the transceiver unit.
- 15. Reconnect the plugs disconnected at step 2.
- 16. Set the transceiver module to the antenna unit and push the module in until it stops. Tighten the fixing bolts. Be sure to push in the transceiver unit until it stops. Failure to do so may cause microwave leakage.
- 17. Fasten the shield wire to the wing nut on the transceiver module.
- 18. Confirm that all screws are tightened and all wiring is properly made. Confirm that the waterproofing gasket, bolts and tapping holes of the antenna unit are coated with silicone grease.
- 19. Close the antenna unit cover.

2.2 Processor Unit

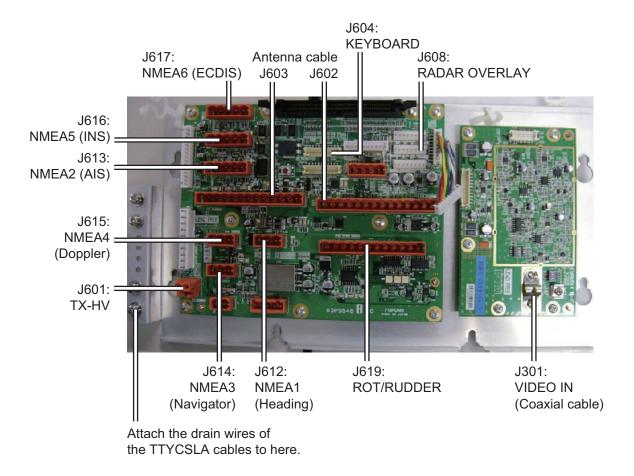

How to fabricate the power cable

- 1. Remove the armor of the cable and the vinyl sheath by 60 mm.
- 2. Remove the vinyl sheath 40 mm.
- 3. Remove the insulation of the cores 10 mm. Fix crimp-on lugs (FV5.5-4, yellow, supplied) to the cores.
- 4. Peel the paint of the armor 40 mm for to make ground connection.
- 5. Cover the end of the armor with vinyl tape. Lay the section where paint was peeled on the cable clamp on the cable entry side of the processor unit. Fasten the cable clamp.
- 6. Fasten the crimp-on lugs to the terminal block.

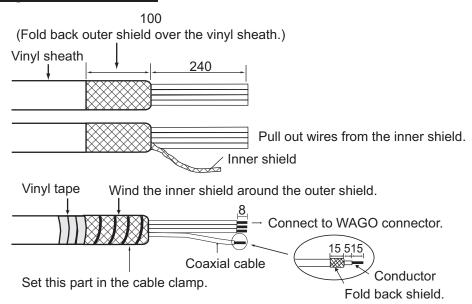

How to connect cables inside the processor unit

Connect cables from the antenna unit and optional equipment are connected to the FRP_TB board (03P9548), inside the processor unit. Open the cover of the processor unit to find the board.

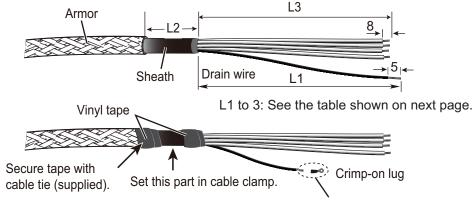

How to fabricate cables connected to the FRP_TB board (03P9548)

Signal cable RW-0013

TTYCSLA cables

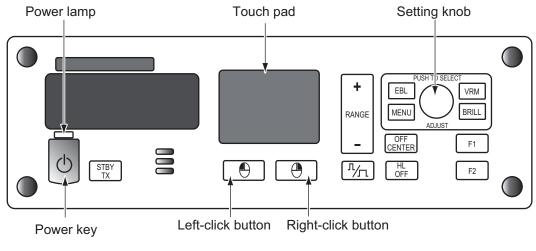

Pass the vinyl tape (local suppy) onto the drain wire. Attach a crimp-on lug (preattached to the processor unit) to the drain wire. Fasten the crimp-on lug to its original location.

Cable lengths of L1, L2 and L3 (mm)

Connector No.	Cable type	L1	L2	L3
J612 (NMEA1)	TTYCSLA-1T	120	60	80
J613 (NMEA2)	TTYCSLA-4	200	60	150
J614 (NMEA3)	TTYCSLA-1	120	60	100
J615 (NMEA4)	TTYCSLA-1	60	100	120
J616 (NMEA5)	TTYCSLA-4	250	80	200
J617 (NMEA6)	TTYCSLA-4	230	80	200
J619 (ROT/RUDDER)	TTYCSLA-7	200	60	120

3. ADJUSTMENTS

At the first power application after installation, open the protected menus to adjust the radar. Follow the procedures in this section, in the order shown, to complete the adjustment.

Control unit

3.1 How to Open the Protected Menus

- 1. Open the cover of the power switch and press the switch to turn on the radar.
- 2. Press the **MENU** key five times while pressing the **HL OFF** key.

MAIN menu

- SERVICE MENU
- INITIALIZE menu

MAIN>CONFIGURATION menu

INSTALLATION menu

BRILL menu and CUSTOM menu

You can edit and save the settings for [BRL1-1] and [CUSTOM1-1].

Back Up general settings

All settings are backed up when the protected menus are unlocked. The saved settings are restored each time the power is turned on.

3.2 How to Set Alarms

For alarm details, see section 1.28.2 "Alarm description" in the Operator's Manual for details.

Alarm sound level

- 1. Press the **MENU** key to show the main menu.
- 2. Use the touch pad to select [13 INITIALIZE], then press the left button (click) to show the [INITIALIAZE] menu.
- 3. Click [ALARM]→[ALARM SOUND LEVEL] menu.
- 4. Click the appropriate sound level of an alarm among [OFF], [LOW], [MID] or [HIGH] (default: [MID]).

How to activate/deactivate alarms

The following alarms can be set on/off.

- [SYSTEM ERROR]: This alarm activates when the system has an error.
- [SENSOR ERROR]: This alarm activates when the sensor signal has an error.
- [AIS ALARM]: This alarm activates when the AIS signal has an error.
- [OTHER WARNING]: For other than the above three alarms.
- 1. Press the **MENU** key to show the main menu.
- 2. Use the touch pad to select [13 INITIALIZE], then press the left button (click) to show the [INITIALIZE] menu.
- 3. Click [ALARM], then click the alarm whose settings you want to change.
- 4. Click [ON] to activate the alarm. When [OFF] is selected, the alarm indication does not appear and the alarm sound is not generated.

3.3 How to Enter Your Ship's Characteristics

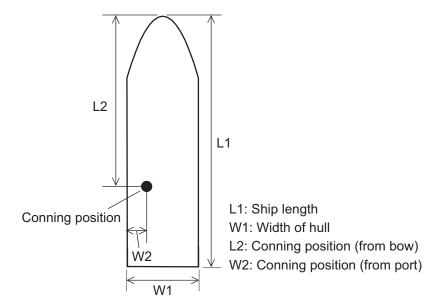

Ship's length and width

- 1. Press the **MENU** key to show the main menu.
- 2. Use the touch pad to select [13 INITIALIZE], then press the left button (click) to show the [INITIALIAZE] menu.
- 3. Click [OWN SHIP INFO] to show the [OWN SHIP INFO] menu.
- Click [LENGTH].
- 5. Rotate the setting knob to set the ship's length.
- Click [WIDTH].
- 7. Rotate the setting knob to set the ship's width.

Conning position

- 1. Open the [MAIN]>[INITIALIZE]>[OWN SHIP INFO] menu.
- Click [CONNING BOW], then input the distance from the bow to the conning position.

3. Click [CONNING - PORT], then input the distance from the port line to the conning position.

Reference point

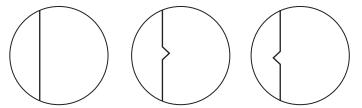

Select the antenna position (refer to section 3.9) or CCRP (Consistent Common Reference Point) as the radar reference point.

- 1. Open the [MAIN]>[CONFIGURATION]>[OPERATION] menu.
- 2. Click [REF POINT].
- 3. Click [ANT] or [CCRP] as reference point.

3.4 How to Adjust Sweep Timing

Sweep timing differs with respect to the length of the signal cable between the antenna unit and the processor unit. Adjust sweep timing at installation to prevent the following symptoms:

- The echo of a "straight" target (for example, pier), on the 0.25 NM range, will appear on the display as being pulled inward or pushed outward. See the figures below.
- The range of target echoes will also be incorrectly shown.

(1) Correct (2) Target pushed inward (3) Target pushed outward Image of a straight pier with different sweep timings

- Set the controls as shown below: GAIN: 80, STC: 0, RAIN: 0, FTC: OFF
- 2. Open the [MAIN]>[CONFIGURATION] menu.
- 3. Click [INSTALLATION] to show the [INSTALLATION] menu.

3. ADJUSTMENTS

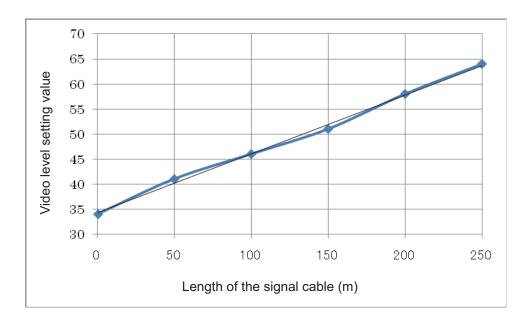

- 4. Click [7 TIMING ADJ] and [AUTO] to activate the automatic adjustment, which takes approx. two minutes.
- After the adjustment is completed, set the radar to the minimum range. Confirm that no echoes are "missing" at the center of the radar screen.
 If echoes are missing, click [9 TIMING ADJ OFFSET] and use the setting knob to adjust the timing manually.

3.5 How to Adjust Video Level

Set the pulse length to LONG, confirm that tuning is stable then do the following.

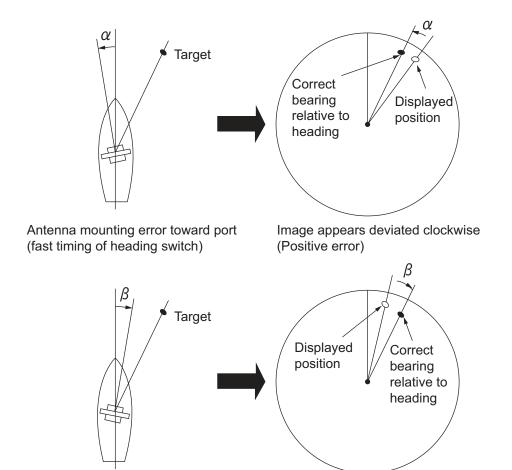

Note: Manual adjustment is not possible when auto adjustment is selected.

- 1. Open the [MAIN]>[CONFIGURATION] menu.
- 2. Click [INSTALLATION] to show the [INSTALLATION] menu.
- 3. Click [3 VIDEO ADJ] and [AUTO] in order to automatically adjust the video level. When using the manual adjustment, refer to the following table.

3.6 Heading Alignment

You have mounted the antenna unit facing straight ahead in the direction of the bow. Therefore, a small but conspicuous target dead ahead visually should appear on the heading line (zero degrees). In practice, you will probably observe some small bearing error on the display because of the difficulty in achieving accurate initial positioning of the antenna unit. The following adjustment will compensate for this error.

Antenna mounting error toward port (fast timing of heading switch)

Image appears deviated clockwise (Positive error)

- 1. Select a stationary target echo at a range between 0.125 and 0.25 NM, preferably near the heading line.
- 2. Operate the **EBL** control to bisect the target echo.
- 3. Read the target bearing.
- 4. Measure the bearing of the stationary target on the navigation chart and calculate the difference between the actual bearing and apparent bearing on the radar screen.
- 5. Open the [MAIN]>[CONFIGURATION] menu.
- 6. Click [INSTALLATION] to show the [INSTALLATION] menu.
- 7. Click [6 HD ALIGN], and enter the bearing difference measured at step 4. The setting range is 0 to 359.9 degrees.
- 8. Confirm that the target echo is displayed at the correct bearing on the screen.

3.7 How to Suppress Main Bang

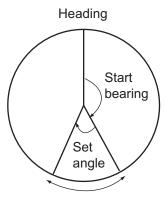

If main bang appears at the screen center, suppress it as follows.

- 1. Transmit the radar on a long range and then wait 10 minutes.
- 2. Adjust gain to show a slight amount of noise on the display.
- 3. Select the 0.125 NM range, and adjust STC and RAIN.

- 4. Open the [MAIN]>[CONFIGURATION] menu.
- 5. Click [INSTALLATION] to show the [INSTALLATION] menu.
- 6. Click [10 MBS], and enter a suitable value so that the main bang disappears. The setting range is 0 to 255.

3.8 How to Set the Transmission Stop Area

If there is a sector(s) on the radar display in which radar echoes cannot be received because of an obstruction near the antenna, set the sector(s) on the menu. Click [SECTOR BLANK 1] or [SECTOR BLANK 2] on the [INSTALLATION] menu and enter the referring to the illustration below.

Stop transmission sector

3.9 How to Set the Radar Antenna Position

Set the radar antenna position at [SCANNER POSITION] on the [INSTALLATION] menu. To set the antenna position on a barge off the ship, enter a negative value.

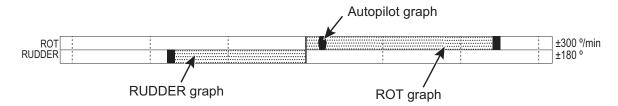

- · Bow: Input distance from the bow to the antenna unit.
- Port: Set the position of antenna unit from the port line of the ship.

3.10 How to Set the GPS Antenna Position

Enter the GPS antenna position from the bow and port sides at the [GPS (FRONT) POSITON] and/or [GPS (AFT) POSITON]. Correct antenna position is necessary to get accurate AIS information.

3.11 How to Adjust the ROT/Rudder/Autopilot Graph (Analog Input Only)

The ROT (Rate of Turn), Rudder and Autopilot graphs, which appear at the top of the display, can be adjusted on the INITIALIZE menu.

ROT, Rudder

- 1. Open the [MAIN]>[INITIALIZE] menu.
- 2. Click [ROT] or [RUDDER].
- 3. Set the external ROT device to zero (Set rudder to 0°).
- 4. Click [OFFSET ADJUST].
- 5. Set the external ROT device to "test position".
- 6. Click [GAIN ADJUST].
- 7. Rotate the setting knob to duplicate the external ROT (or Rudder) indication on the radar.
- 8. Push the left button.

Autopilot

- Set external autopilot to "Follow-up".
- 2. Open the [MAIN]>[INITIALIZE]>[AUTOPILOT] menu.
- 3. Set the autopilot to 0°.
- 4. Click [OFFSET ADJUST].
- 5. Set the autopilot to max. PS (port side) or SB (starboard side).
- 6. Click [GAIN ADJUST].
- 7. Rotate the setting knob so that the autopilot indicator on the radar display shows the same heading indication as the associated autopilot.

3. ADJUSTMENTS

This page is intentionally left blank.

APPENDIX 1 JIS CABLE GUIDE

Cables listed in the manual are usually shown as Japanese Industrial Standard (JIS). Use the following guide to locate an equivalent cable locally.

JIS cable names may have up to 6 alphabetical characters, followed by a dash and a numerical value (example: DPYC-2.5).

For core types D and T, the numerical designation indicates the *cross-sectional Area* (mm²) of the core wire(s) in the cable.

For core types M and TT, the numerical designation indicates the *number of core wires* in the cable.

1. Core Type

2. Insulation Type

3. Sheath Type

D: Double core power lineT: Triple core power line

P: Ethylene Propylene Rubber

Y: PVC (Vinyl)

M: Multi core

TT: Twisted pair communications (1Q=quad cable)

4. Armor Type

5. Sheath Type

S: All cores in one sheath

C: Steel

Y: Anticorrosive vinyl sheath

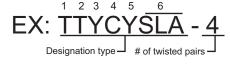

-S: Indivisually sheathed cores

SLA: All cores in one shield, plastic tape w/aluminum tape

Shielding Type

-SLA: Individually shielded cores,
plastic tape w/aluminum tape

6.

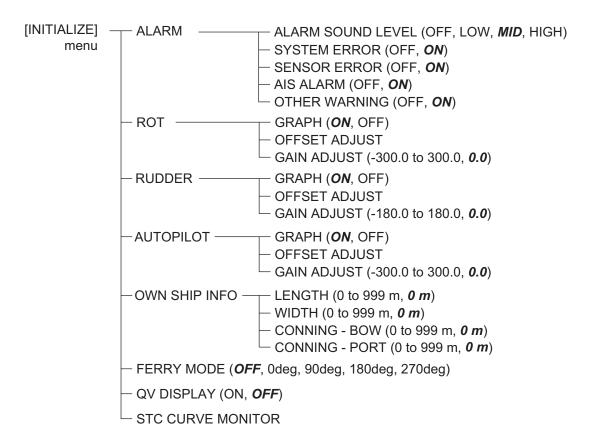

The following reference table lists gives the measurements of JIS cables commonly used with Furuno products:

	Со	re	Cable		Co	ore	Cable
Туре	Area	Diameter	Diameter	Туре	Area	Diameter	Diameter
DPYC-1.5	1.5mm ²	1.56mm	11.7mm	TTYCS-1	0.75mm ²	1.11mm	10.1mm
DPYC-2.5	$2.5 mm^2$	2.01mm	12.8mm	TTYCS-1T	0.75mm^2	1.11mm	10.6mm
